

FIAMA NORTH LODGE EXTENDED TO 160M STRIKE AND 200M BELOW SURFACE

PHASE 1 DRILL RESULTS EXTEND GOLD MINERALISATION AT FIAMA

Antipa Minerals Ltd (ASX: **AZY**) (**Antipa** or **the Company**) is pleased to report the first batch of assay results from CY2026 drilling at its 100%-owned, 4,500km² Minyari Gold-Copper Project (**Minyari Project**), in Western Australia's world-class Paterson Province (see Figure 1).

These results comprise 15 reverse circulation (**RC**) drill holes for 3,352 metres, all from the broader Fiama area, with ten holes testing the recently identified Fiama North lode.

Drilling has extended Fiama North to approximately 160 metres of strike and 200 metres below surface, with the lode remaining open in all directions.

The Phase 1 CY2026 programme targets both new discoveries and growth of existing deposits, with three rigs currently drilling at GEO-01 Main Zone, Tim's Dome, and AL01.

HIGHLIGHTS

Fiama North lode extended

- **New Fiama northern lode extended 160m along strike and 200m below surface**
- **Fiama and the newly discovered northern lode remain open in all directions**
- Notable intersections include:
 - **26m at 1.5 g/t gold** and 0.09% copper from 275m in 26XMDC0960 (Fiama), including:
 - **3m at 2.2 g/t gold** and 0.10% copper from 277m
 - **10m at 2.6 g/t gold** and 0.12% copper from 290m
 - **22m at 0.9 g/t gold and 0.23% copper** from 135m in 26XMDC0961 (Fiama north), including:
 - **1m at 3.8 g/t gold** and 0.11% copper from 135m
 - **1m at 1.7 g/t gold and 0.58% copper** from 144m
 - **3m at 1.5 g/t gold, 0.54% copper** and 1.2 g/t silver from 151m
 - **10m at 1.3 g/t gold and 0.22% copper** from 147m in 26XMDC0963 (Fiama north), including:
 - **6m at 1.8 g/t gold and 0.24% copper** from 150m, also including:
 - **1m at 5.3 g/t gold and 0.49% copper** from 155m

Active drilling across the broader Minyari Project

- **RC drilling underway at Tim's Dome**, located approximately 30km southwest of Minyari and 11km from the Greatland's Telfer gold-copper mine and processing facility.
- **Air core drilling commenced in late June along the 4km-long AL01 gold-copper corridor**, located approximately 17km north of Minyari.
- **Diamond drilling underway at GEO-01 Main Zone**, located approximately 1.5km southeast of Minyari.
- **Antipa awarded multiple drilling grants totalling A\$400k** under the WA Government's Exploration Incentive Scheme.

Antipa's Managing Director, Roger Mason, commented

"These first results from our CY2026 drilling programme have certainly delivered a strong start, extending the new Fiamma North lode to approximately 160 metres of strike and 200 metres below surface, where it remains open in all directions.

Fiamma continues to show very high potential within the broader Minyari Dome mineral system, with these results suggesting strong potential for further resource growth.

The CY2026 programme is focused on extending known areas of mineralisation in parallel with testing a series of priority discovery opportunities across our 100%-owned Minyari Project, including the Tim's Dome, AL01 and Mollie targets.

We are now actively drilling at both Tim's Dome and AL01, providing shareholders with multiple near-term exploration catalysts across a district-scale gold-copper project in one of Australia's most strategically important mineral provinces".

Figure 1: Plan showing location of Antipa's 100%-owned, 4,500km² Minyari Project: Plan includes Greatland Resources' Telfer Mine, Havieron development project and O'Callaghans deposit, Rio Tinto-Sumitomo's Winu deposit, Rio Tinto's Calibre-Magnum deposits, and Cyprium's Nifty Mine¹. NB: Regional GDA2020 / MGA Zone 51 co-ordinates, 50km grid.

¹ Telfer, Havieron and O'Callaghans refer to Greatland Resources Ltd ASX release dated 30 March 2026, "December 2025 Group Mineral Resource Statement". Winu refer to Rio Tinto Ltd ASX release dated 22 February 2023, "Changes to Ore Reserves and Mineral Resources". Nifty refer to Cyprium Metals Ltd ASX release dated 14 March 2024, "Updated Nifty MRE Reaches 1M Tonnes Contained Copper". Calibre refer to Antipa release dated 26 August 2024, "Calibre Gold Resource Increases 19% to 2.5 Moz - Citadel JV". Magnum refer to Antipa release dated 23 February 2015, "Calibre and Magnum Deposit Mineral Resource JORC 2012 Updates".

PHASE 1 CY2026 DRILLING PROGRAMME OUTLINE¹

The ongoing Phase 1 CY2026 programme is scheduled to comprise 321 holes for 41,000m, incorporating air core, RC and diamond core drilling. Currently 106 Phase 1 drill holes for 13,207m have been completed (52 RC holes for 10,096m and 54 air core holes for 3,111m).

The programme has two primary objectives:

- test high-priority regional greenfield targets to deliver new gold and copper discoveries; and
- enable further growth to the existing Minyari Dome gold-copper deposits.

The programme is expected to run into Q3 CY2026 and is fully funded through Antipa's existing cash balance supplemented by the Exploration Incentive Scheme (**EIS**) grants¹. Assay results will continue to be reported in batches as they become available.

Minyari Project New Discovery Drilling Programme¹

- Scheduled to comprise 258 holes for approximately 26,540m, including 205 air core holes (13,280m), 51 RC holes (11,960m) and two diamond core holes (1,300m).
- Initial RC drilling focussed on multiple Minyari Dome gold and copper targets, including Fiama (new northern lode) and Yolanda, prior to the RC rig relocating to Tim's Dome.
- The air core rig arrived late June and commenced drilling along the 4km long AL01 gold corridor.
- Additional discovery drilling will focus on priority gold ± copper greenfield targets and existing prospects proximate to the Minyari Dome deposits including, but not limited to, Chicken Ranch, Jezabeel, Judes and Mollie.

Minyari Dome Deposit Growth Drilling Programme¹

- Targeting expansion of the existing near-surface Minyari Dome Mineral Resource, which currently stands at 2.5 Moz of gold, including 2.2Moz at 1.6 g/t gold in the Indicated category².
- Scheduled to comprise 63 holes for approximately 14,200m, including 61 RC holes (13,000m) and two diamond core holes (1,200m).
- RC and diamond core drilling (diamond rig arrived late June) is focussing on extending the resources across the GEO-01 combined 1km north-south by 1km east-west area, where several deposits remain open down-dip and in some cases along strike.

CY2026 BATCH ONE DRILLING RESULTS DETAIL

Results from the first batch of Phase 1 CY2026 results comprised 15 RC drill holes (3,352m sampled), all from the Fiama area with 10 holes testing the new Fiama north lode, refer to Tables 1 and 2 and Figures 2 to 12.

The Fiama North lode is located approximately 65 metres north of Fiama and was first reported in February 2026. The latest RC drilling has extended gold and copper mineralisation to approximately 160 metres of strike and 200 metres below surface. The lode remains open in all directions.

Notable batch 1 intersections include (refer Table 1 and see Figures 2 to 12):

- **26m at 1.5 g/t gold** and 0.09% copper from 275m in 26XMDC0960 (Fiama), including:
 - **3m at 2.2 g/t gold** and 0.10% copper from 277m
 - **10m at 2.6 g/t gold** and 0.12% copper from 290m

¹ Exploration programmes are subject to changes which may be made consequent upon results, field conditions and ongoing review.

² For full details refer to ASX release dated 2 April 2026, "Minyari Project Resource Grows to 3.6 Moz Gold Equivalent".

- **22m at 0.9 g/t gold and 0.23% copper** from 135m in 26XMDC0961 (Fiama north), including:
 - **1m at 3.8 g/t gold** and 0.11% copper from 135m
 - **1m at 1.7 g/t gold and 0.58% copper** from 144m
 - **3m at 1.5 g/t gold, 0.54% copper** and 1.2 g/t silver from 151m
- **10m at 1.3 g/t gold and 0.22% copper** from 147m in 26XMDC0963 (Fiama north), including:
 - **6m at 1.8 g/t gold and 0.24% copper** from 150m, also including:
 - **1m at 5.3 g/t gold and 0.49% copper** from 155m
- **31m at 0.6 g/t gold** and 0.04% copper from 69m in 26XMDC0958 (Fiama north), including:
 - **16m at 1.0 g/t gold** and 0.06% copper from 84m, also including:
 - **1m at 2.4 g/t gold** and 0.04% copper from 84m, and;
 - **1m at 3.3 g/t gold** and 0.16% copper from 89m
- **48m at 0.4 g/t gold** and 0.02% copper from 55m in 26XMDC0969 (GEO-01 Central), including:
 - **2m at 1.6 g/t gold** and 0.08% copper from 70m
 - **12m at 0.8 g/t gold**, 0.04% copper and 1,678 ppm cobalt from 85m

ACTIVE DRILLING ACROSS THE BROADER MINYARI PROJECT

Tim's Dome

Tim's Dome is a satellite gold deposit located 30km southwest of the standalone Minyari gold-copper development opportunity and 11km from Greatland Resources Ltd's Telfer gold-copper mine and processing facility.

The deposit hosts a Mineral Resource Estimate (**MRE**) of 110koz gold and the stratigraphy present at Tim's Dome correlates directly to the key mineralised domains at Telfer, including lithological elements critical to the style and tenor of high-grade gold mineralisation, and northwest strike continuation of the Telfer domal fold structure.

Gold and copper mineralisation at Tim's Dome extend for 4.7km of strike along the domal fold axis and eastern fold limb.

Phase 1 RC and diamond programme commenced with RC drilling in mid-June CY2026 and is focussed on testing:

- an aerial electromagnetic (**AEM**) bedding parallel conductivity anomaly along 1km of strike within Telfer Middle Vale Reef (**MVR**) host rock (Figures 1 and 2 and Figures 13 to 15). Noting that at Telfer the MVR has produced approximately 5Moz of gold;
- gold anomalies generated by the 2025 air core drilling; and
- Mineral Resource growth along strike and down dip.

Antipa has been awarded a WA Government A\$180k EIS grant to co-fund drilling at Tim's Dome.

AL01

The AL01 target area is located 17km north of Minyari and comprises multiple large gold-copper and associated strong pathfinder anomalies over a combined strike of 4km.

The anomalies remain open in most directions (Figures 2 and 16) and were generated by earlier broad-spaced air core drilling prior to this year, with previous drilling constrained by limited heritage survey lines.

A detailed heritage survey was completed in July 2025 to enable more systematic drill testing across the AL01 corridor. An air core rig has subsequently commenced systematic drilling at AL01 from late June this year.

Subject to results, RC drilling has been planned as a Phase 1 follow-up programme¹.

Mollie

Mollie is a base metal, tungsten and precious metal skarn target located 30km southeast of Telfer.

The target is defined by a large, coincident magnetic-gravity high anomaly measuring approximately 1.2km by 1.8km (Figures 2 and 17). The modelled depth of the geophysical anomaly is 400m below surface, beneath shallow cover ranging from approximately 3m to 60m.

This exciting target is interpreted to sit at the intersection of east-northeast fault and northwest anticlinal fold axis within favourable Malu and/or Isdell Formation calcareous meta-sediments.

Limited historic drilling failed to reach the magnetic source (maximum historic drill depth 130m) but returned 4m at 0.12 g/t gold and 3m at 0.14 g/t gold above the magnetic target.

The Mollie skarn target is 25km from Greatland Resources Ltd's O'Callaghan's skarn deposit one of the largest high-grade tungsten deposits globally and Australia's largest tungsten Mineral Resource (246kt WO₃ plus zinc, copper and lead)², and Paterson Resource Ltd's Grace gold-copper breccia (200koz gold Mineral Resource³) which is 6km northwest along strike from Mollie.

Antipa has been awarded a Western Australian Government A\$220k EIS grant to co-fund drilling at Mollie.

GOVERNMENT EXPLORATION INCENTIVE SCHEME CO-FUNDED DRILLING GRANTS

In April 2026, Antipa was awarded two co-funded drilling grants totalling A\$400,000 under the Western Australian Government's EIS.

The grants relate to testing geophysical targets at both Tim's Dome and Mollie, accelerating gold and base metal exploration in the highly prospective Paterson Province.

The EIS programme is a competitive state government initiative that offsets up to 50% of direct drilling costs to encourage early-stage discoveries in greenfield areas, providing non-dilutive funding support for Antipa's CY2026 exploration programme.

NEXT STEPS

The Phase 1 CY2026 drilling programme remains ongoing, with drilling active at GEO-01 Main Zone, Tim's Dome and AL01.

Near-term activities include:

- ongoing diamond core drilling at GEO-01 Main Zone;
- continued RC and future diamond drilling at Tim's Dome;
- ongoing air core drilling across the AL01 corridor;
- future diamond drilling at Mollie;
- planned follow-up (RC) drilling subject to assay results and geological interpretation;
- further drilling at priority discovery and resource growth targets across the Minyari Project; and
- progressive reporting of assay results in batches as they become available.

Antipa will provide further updates as drilling progresses and additional assay results are received.

¹ Exploration programmes are subject to changes which may be made consequent upon results, field conditions and ongoing review.

² O'Callaghans refer to Greatland Resources Ltd ASX release dated 30 March 2026, "December 2025 Group Mineral Resource Statement". Grace refer to Paterson Resources Ltd ASX release dated 3 June 2026, "Significant MRE Update to 200,000oz Au at Grace Gold Project".

Figure 2: Plan of the central region of Antipa's Minyari Project: Showing gold ± copper greenfield targets and existing prospects, within a 65km corridor which extends approximately 35km northwest and 30km southeast of the Minyari Dome development opportunity, being evaluated during the CY2026 Phase 1 drill programme (red shaded polygons). Note the location of AL01 north of Minyari and Tim's Dome southwest of Minyari. This structural domain hosts Greatland Resources Ltd's Telfer Mine and Havieron development project¹, and along trend to the northwest (off this map) are Rio Tinto-Sumitomo's Winu development project and Rio Tinto's Calibre and Magnum deposits. NB: Regional GDA2020 / MGA Zone 51 co-ordinates, 20km grid, over a grayscale aeromagnetic image.

¹ Telfer, Havieron and O'Callaghans refer to Greatland Resources Ltd ASX release dated 30 March 2026, "December 2025 Group Mineral Resource Statement".

Figure 4: Long Section from south of Fiama to Minyari North: Including the Minyari, WACA, Minyari South, Minyari Southeast and GEO-01 area (i.e. Main Zone, Fiama, Minella and Central) deposits and recently discovered southern extensions south of Rizzo and Fiama, showing gold drill intercepts. Highlights multiple zones of plunging gold-copper resources and mineralisation variously open down dip/plunge from depths below the surface as shallow as 40m to 650m. Note this highly prospective 3.6km trend extends to approximately 5.0km to the Judea copper-silver-gold deposit to the north. NB: 500m elevation (RL), looking toward Local Grid 270° (or 238° MGA Zone 51 Grid).

Figure 5: GEO-01 Main Zone, Fiuma, Minella and GEO-01 Central deposits and southern Rizzo-Fiuma South discovery extension region plan view showing gold ± copper drill annotation and intersections and interpreted mineralisation envelopes: Folded and faulted hard/brittle quartzite and mafic (dolerite) intrusives are preferentially mineralised. Multiple zones of mineralisation remain open, including high-grade, with highly prospective Fiuma-Rizzo folded dolerite and meta-sediment strike length 500 to 800m, and an across-strike width of 120 to 160m. NB: Regional GDA2020 / MGA Zone 51 co-ordinates and 250m grid.

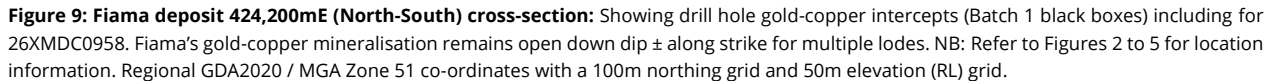

Figure 8: Figma deposit 424,110mE (North-South) cross-section: Showing drill hole gold-copper intercepts (Batch 1 black boxes) including for 26XMD0963. Figma's gold-copper mineralisation remains open down dip ± along strike for multiple lodes. NB: Refer to Figures 2 to 5 for location information. Regional GDA2020 / MGA Zone 51 co-ordinates with a 100m northing grid and 50m elevation (RL) grid.

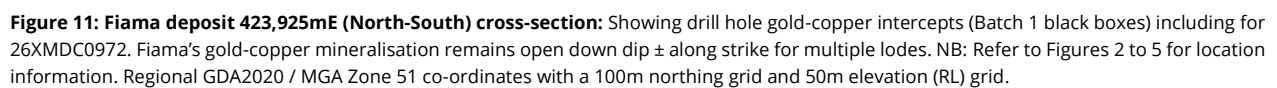

Figure 10: Fiams deposit 423,800mE (North-South) cross-section: Showing drill hole gold-copper intercepts (Batch 1 black boxes) including for 26XMD0969. Fiams's gold-copper mineralisation remains open down dip $\pm$ along strike for multiple lodes. NB: Refer to Figures 2 to 5 for location information. Regional GDA2020 / MGA Zone 51 co-ordinates with a 100m northing grid and 50m elevation (RL) grid.

Figure 12: Fiama deposit 423,925mE (North-South) cross-section: Showing drill hole gold-copper intercepts (Batch 1 black boxes) including for 26XMDC0962. Fiama's gold-copper mineralisation remains open down dip ± along strike for multiple lodes. NB: Refer to Figures 2 to 5 for location information. Regional GDA2020 / MGA Zone 51 co-ordinates with a 100m northing grid and 50m elevation (RL) grid.

Figure 13: Satellite image plan view over the broader Tim's Dome (Antipa) to Telfer (Greatland) region: Tim's Dome 110koz gold resource is located 30km SW of Antipa's standalone Minyari gold-copper development opportunity and 11km NW of Greatland's Telfer gold-copper mine and processing facility¹. Tim's Dome is the northwest strike continuation of the Telfer host rocks and Telfer domal fold structure. Gold ± copper mineralisation extends for 4.7km of strike along the fold axis and eastern fold limb. NB: Refer to Figures 2 to 5 for location information. Regional GDA2020 / MGA Zone 51 co-ordinates with a 10km grid.

¹ Telfer refer to Greatland Resources Ltd ASX release dated 30 March 2026, "December 2025 Group Mineral Resource Statement".

Figure 14: Conceptual structural model 3D-perspective (oblique) long-section of potential Tim's Dome reef style gold-copper mineralisation: Based on extrapolation of the established Tim's Dome structural framework and comparison to known gold-copper mineralisation styles in the adjacent Telfer mineral system. The Telfer Main Dome mineralisation is preferentially developed along the domal fold axis and eastern fold limb; with bedding parallel high-grade reefs preferentially located where steep cross-cutting ore fluid conduit structures intersect reactive lithologies/contacts. Refer also to the Figure 15 conceptual cross-section.

Figure 15: Conceptual structural model cross-section of potential Tim's Dome gold-copper mineralisation styles: Based on extrapolation of the established Tim's Dome structural framework and comparison to known gold-copper mineralisation styles in the adjacent Telfer mineral system. Potential gold-copper mineralisation styles include bedding parallel reefs, discordant thrust controls (including monoclinal deformation zones) and cross-cutting "feeder" conduits and stockworks exploiting the domal fold axis and axial planar structures; with mineralisation preferentially developed along the fold axis and eastern fold limb.

Figure 16: Plan view image over the AL01 gold-copper air core trend: Showing maximum down-hole gold drill results (ppb) over grey-scale aeromagnetic image. AL01 is located 17km north of Minyari, has multiple large gold-copper and associated strong pathfinder anomalies with a combined strike of 4km, which remain open in most directions. Anomalies were generated by air core drilling prior to this year, which was broad spaced due to limited heritage survey lines. A detailed heritage survey was completed in July last year to facilitate systematic drill testing of the AL01 gold trend. NB: GDA2020 / MGA Zone 51 co-ordinates, 1km grid.

Figure 17: Plan view image over the broader Mollie skarn target (Antipa) to Telfer (Greatland) region: Showing maximum down-hole gold drill results over pseudo-colour aeromagnetic image. The Mollie target is a discrete strong coincident magnetic-gravity high anomaly approximately 1.2km by 1.8km in size at a modelled depth below surface of 400m, located at the intersection of an ENE trending fault and anticlinal fold axis within interpreted Isdell Formation calcareous meta-sediments. Six kilometres NW along trend from Mollie is the Grace breccia-style gold-copper deposit and 200koz gold resource hosted within interpreted Malu and Isdell Formation metasediments including dolomite, and Mollie is 25km from Greatland's O'Callaghan's skarn deposit which is Australia's largest tungsten resource¹. Shallow cover at Mollie (3 to 60m), with minor historic drilling failing to reach the magnetic source (max. drill hole depth 130m) but returning 4m at 0.12 g/t and 3m at 0.14 g/t gold above the magnetic target. NB: GDA2020 / MGA Zone 51 co-ordinates, 10km grid.

¹ O'Callaghans refer to Greatland Resources Ltd ASX release dated 30 March 2026, "December 2025 Group Mineral Resource Statement". Grace refer to Paterson Resources Ltd ASX release dated 3 June 2026, "Significant MRE Update to 200,000oz Au at grace Gold Project".

About Antipa Minerals Ltd

Antipa Minerals Ltd (ASX: **AZY**) (Antipa or the **Company**) is a leading mineral exploration company with a proven track record of discovering world-class gold-copper deposits in the highly prospective Paterson Province of Western Australia. The Company remains focussed on advancing its exploration and development programmes to unlock the full potential of this richly endowed region, which offers substantial opportunities for profitable mining operations. Antipa's tenement holding, known as the **Minyari Project**, covers approximately 4,500km² and host total 100%-owned Mineral Resources of 2.9 million ounces (**Moz**) of gold, 91,000 tonnes (**t**) of copper, 880 thousand ounces (**koz**) of silver and 13,000 tonnes of cobalt, situated in a region home to Greatland Resources' Telfer mine and 22Mtpa processing facility, as well as large scale gold-copper-silver development projects including Rio Tinto-Sumitomo's Winu and Greatland's Havieron.

Antipa's exploration success at Minyari includes the discovery of several significant mineral deposits at its flagship Minyari Dome Gold-Copper precinct. Minyari Dome, which forms the basis of the ongoing Pre-Feasibility Study, currently hosts a 2.5 Moz gold Mineral Resource at 1.5 grams per tonne (**g/t**) plus copper, silver, and cobalt (**April 2026**). An October 2024 Updated Scoping Study for Minyari Dome indicated the potential for a substantial standalone development opportunity with further upside potential. This year's Minyari Dome drilling programmes were aimed at further rapid and substantial growth of the existing gold-copper resources at Minyari Dome and were designed to enhance the value of the current development opportunity while also targeting new significant gold-copper discoveries.

At a regional level, Minyari provides access to further tier one gold-copper discovery opportunities. Significant discovery and resource growth drill programmes are envisaged to test a host of exciting high-potential gold ± copper prospects and greenfield targets primed for follow-up or initial drill testing.

Antipa is well-positioned to continue its resource growth and project development trajectory targeting significant value creation for its shareholders through focussed exploration and sensible development in one of the world's most promising gold-copper regions.

Forward-Looking Statements: This document may include forward-looking statements. Forward-looking statements include, but are not limited to, statements concerning Antipa Mineral Ltd's planned exploration programme, the Minyari Development PFS and associated workstreams, and other statements that are not historical facts. When used in this document, words such as "could," "plan," "estimate," "expect," "intend," "may," "potential," "should," and similar expressions are forward-looking statements. Although Antipa Minerals Ltd believes that its expectations reflected in these forward-looking statements are reasonable, such statements involve risks and uncertainties, and no assurance can be given that actual results will be consistent with these forward-looking statements.

Table 1 Drill Results Notes:

Refer to JORC Table 1 Section 1 for full drill hole information; including drill technique, sampling, analytical technique/s, etc

Table intersections are length-weighted assay intervals reported using the following criteria:

Intersection Interval = Nominal cut-off grade scenarios:

- ≥ 0.10 ppm (g/t) gold; and/or
- ≥ 300 ppm (0.03%) copper (Discovery drilling) or ≥ 400 ppm (0.04%) copper (PFS Resource Growth or Definition drilling); and/or
- ≥ 0.70 ppm (g/t) silver; and/or
- ≥ 400 ppm (0.04%) cobalt.
- No top-cutting has been applied to these individual assay intervals.
- Intersections are down hole lengths, true widths not known with certainty, refer to JORC Table 1 Section 2.
- To convert ppm to percent (%) divide ppm by 10,000.
- Refer to JORC Table 1 Section 1 for full drill hole information; including drill technique, sampling, analytical technique/s, etc.

Hole ID Annotation:

Hole ID# = Drillhole/s with 1m re-sampling from 4m composites

Table 2a: Minyari Project – Exploration Programme
Reverse Circulation and Diamond Core Drill Hole Collar Locations (MGA Zone 51/GDA2020)

Table 2a-b Drill Hole Collar Notes:

Refer to JORC Table 1 Section 1 for full drill hole information; including drill technique, sampling, analytical technique/s, etc.

Hole ID Annotation:

Hole ID* = Drillhole/s Abandoned

Hole ID** = Drillhole/s pending further assay results

Hole ID+ = Drillhole/s in progress

Hole ID# = Drillhole/s with 1m re-sampling from 4m composites

Drill Type Annotation:

RC = Reverse Circulation

DD = Diamond Core

DD Tail = Diamond Core depth extension of a pre-existing RC or DD drill hole

AC = Air Core

Programme Annotation:

Discovery-Focused Drill Programme = Discovery

Resource Growth-Focused Drill Programme = Growth

Pre-feasibility Study (PFS) Drill Programme = PFS (NB: Includes Mineral Resource Definition)

Sterilisation Drill Programme = Sterilisation (NB: Generally for the purpose of locating infrastructure)

In relation to Exploration Results extracted from previously announced reports (see reference list below), the Company confirms that it is not aware of any new information or data that materially affects the information included in the original market announcement, all of which are available to view on www.antipaminerals.com.au and www.asx.com.au. The Company confirms that the form and context in which the Competent Person's findings are presented have not been materially modified from the original market announcements.

Various information in this announcement which relates to Exploration Results have been extracted from the following announcements lodged on the ASX, where further details, including JORC Code reporting tables, can also be found:

• <i>North Telfer Project Update on Former NCM Mining Leases</i>	3 December 2015
• <i>High Grade Gold Mineralisation at Minyari Dome</i>	8 February 2016
• <i>Minyari Deposit Drilling to Commence May 2016</i>	2 May 2016
• <i>Minyari Phase 1 Drilling Commences</i>	2 June 2016
• <i>Further Historical High-grade Gold Intersections at Minyari</i>	14 June 2016
• <i>Minyari Phase 1 Drilling Update No. 1</i>	20 July 2016
• <i>Completion of Phase 1 Minyari Deposit RC Drilling Programme</i>	9 August 2016
• <i>Minyari Drilling Update No. 3</i>	17 August 2016
• <i>Minyari Drilling Update No. 4</i>	29 September 2016
• <i>North Telfer and Citadel Exploration Programme Update</i>	16 November 2016
• <i>Minyari Dome Drilling Update No. 1</i>	16 December 2016
• <i>Minyari Dome and Citadel – Phase 2 Update</i>	9 February 2017
• <i>Minyari Dome Positive Metallurgical Test Work Results</i>	13 June 2017
• <i>High-Grade Gold Intersected at North Telfer Project Revised</i>	21 June 2017
• <i>Drilling Extends High-Grade Gold Mineralisation at WACA</i>	25 July 2017
• <i>High-Grade Gold Mineralisation Strike Extension at Minyari Deposit</i>	4 August 2017

- **Competent Persons Statement – Exploration Results:** The information in this document that relates to Exploration Results is based on and fairly represents information and supporting documentation compiled by Mr Roger Mason, a Competent Person who is a Member of The Australasian Institute of Mining and Metallurgy. Mr Mason is a full-time employee of the Company. Mr Mason is the Managing Director of Antipa Minerals Limited, is a substantial shareholder of the Company and is an option holder of the Company. Mr Mason has sufficient experience relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaking to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Mr Mason consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

- **Competent Persons Statement – Mineral Resource Estimations for the Minyari Project Deposits:** The information in this document that relates to the estimation and reporting of the Minyari, WACA, WACA West and Sundown deposit Mineral Resources is extracted from the report entitled "Minyari Project Resource Grows to 3.6 Moz Gold Equivalent" created on 2 April 2026 with Competent Person Jane Levett. The information in this document that relates to the estimation and reporting of the: (1) GEO-01 Main Zone, Fama, Minella, GEO-01 Central, Rizzo, GEO-01 South and RPS deposit Mineral Resources is extracted from the report entitled "Minyari Project Resource Grows to 3.6 Moz Gold Equivalent" created on 2 April 2026; (2) Minyari South deposit Mineral Resource is extracted from the report entitled "Minyari Development Resource Grows to 3.3Moz Gold Equivalent" created on 18 December 2025; (3) Tim's Dome and Chicken Ranch deposits Mineral Resources are extracted from the report entitled "Minyari Project Resource Grows by 100 koz to 2.5 Moz of Gold" created on 21 May 2025; and (4) Minyari North deposit Mineral Resource is extracted from the report entitled "100% Owned Minyari Dome Project Grows by 573,000 Oz of Gold" created on 17 September 2024; with Competent Person Victoria Lawns. These reports are available to view on www.antipaminerals.com.au and www.asx.com.au. The Company confirms that it is not aware of any new information or data that materially affects the information included in the original market announcements and that all material assumptions and technical parameters underpinning the estimates in the relevant original market announcements continue to apply and have not materially changed. The Company confirms that the form and context in which the Competent Persons' findings are presented have not been materially modified from the original market announcements.

- **Competent Persons Statement – Metallurgy:** The metallurgy and the processing information in this announcement is based on and fairly represents information compiled or reviewed by Mr Nick Vines. Mr Vines is a full-time employee of Strategic Metallurgy Pty Ltd. Mr Vines has confirmed that he has read and understood the requirements of the 2012 Edition of the Australian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves. Mr Vines is a Competent Person as defined by the JORC Code 2012 Edition, having more than five years' experience which is relevant to the processing method and type of deposit under consideration and to the activity for which he is accepting responsibility. Mr Vines is a Member of

the AusIMM and consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

- **Scoping Study for Minyari Dome:** The information in this document that relates to the Scoping Study for Minyari Dome is extracted from the report entitled “Minyari Scoping Study Update Confirms Development Potential” reported on 24 October 2024, which is available to view on www.antipaminerals.com.au and www.asx.com.au.

Minyari Project April 2026 Mineral Resource Estimate

Notes for the Minyari Project MRE Table:

1. Rounding of numbers may cause apparent discrepancies in totals.
2. For full details of the Minyari Project Mineral Resources Estimate, please refer to ASX announcements dated: 2 April 2026 entitled “Minyari Project Resource Grows to 3.6 Moz Gold Equivalent”, 18 December 2025 entitled “Minyari Development Resource Grows to 3.3Moz Gold Equivalent”, 21 May 2025 entitled “Minyari Project Resource Grows by 100 koz to 2.5 Moz of Gold”, and 17 September 2024 entitled “100% Owned Minyari Dome Project Grows by 573,000 Oz of Gold”.
3. The Minyari Dome MRE has been reported within optimised open pit shells at a cut-off grade of 0.3 g/t gold and within optimised (MSO) underground stopes with a Net Smelter Return (NSR) ≥ A\$100, using metal prices of US\$5,000/oz gold, A\$65 silver and AUD/USD of 0.65 and cost and revenue assumptions.
4. The satellite deposits Tim’s Dome, Chicken Ranch and RPS MREs have been reported at cut-off grades above 0.3 g/t gold which assumes open pit mining.
5. The Minyari Project and its Mineral Resource are 100% owned by Antipa Minerals Ltd.

Gold Metal Equivalent Information - Minyari Project Mineral Resource Gold Equivalent Calculation:

A gold equivalent grade (**Aueq**) has been calculated from individual gold, copper, silver, and cobalt grades. This equivalent grade has been calculated and declared in accordance with Clause 50 of the JORC Code (2012) that it is the Company's opinion that all metals included in this metal equivalent calculation have reasonable potential to be recovered and sold, using the following parameters:

- The metal prices used for the calculation are as follows:
 - US\$ 2,030 /oz gold
 - US\$ 4.06 / lb copper
 - US\$ 24.50 /oz silver
 - US\$ 49,701 per tonne cobalt
- An exchange rate (A\$:US\$) of 0.700 was assumed.
- Metallurgical recoveries for by-product metals, based upon Antipa test-work in 2017 and 2018, are assumed as follows:
 - Gold = 88.0% Copper = 85.0%, Silver = 85%, Cobalt = 68%
- The gold equivalent formula, based upon the above commodity prices, exchange rate and recoveries, is thus:
 - **Aueq** = (Au g/t) + (Ag g/t * 0.012) + (Cu % * 1.32) + (Co % * 5.88)

ANTIPA MINERALS LTD - MINYARI PROJECT

CY2026 Discovery, Growth and Pre-feasibility Study Drill Programmes – Reverse Circulation, Diamond Core and Air Core

JORC Code 2012 Edition:

Table 1 - Section 1 Sampling Techniques and Data (Criteria in this section shall apply to all succeeding sections)

Criteria	JORC Code Explanation	Commentary
Sampling techniques	<i>Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</i> <i>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</i> <i>Aspects of the determination of mineralisation that are Material to the Public Report.</i> <i>In cases where ‘industry standard’ work has been done this would be relatively simple (e.g. ‘reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay’). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g., submarine nodules) may warrant disclosure of detailed information.</i>	Reverse Circulation (RC) Sampling - CY2026 to date various prospects and targets have been sampled for growth and discovery purposes by 52 RC holes for a total of 10,096 metres, with an average hole depth of 194m (including three abandoned RC holes for 258m). - Assay results have been received for 14 entire holes and one partial hole (i.e. 135m of 308m; 173m results pending). - RC Sampling was conducted under Antipa protocols and QAQC procedures as per industry best practice. - All RC samples were drilled using a 140mm diameter face sampling hammer with samples taken on one metre intervals. - Individual one metre (2 to 3 kg) samples or two to four metre composite samples (2 to 3 kg) were submitted for laboratory analysis. - If warranted and based on anomalous laboratory assay results of (2 to 4m) composite samples, additional individual one metre samples may also be collected and submitted for laboratory analysis. Diamond Core Drill (DD) Sampling - The first diamond core drill hole of the CY2026 programme is in progress. - No assay results have been received. - Diamond core sampling is conducted under Antipa protocols and QAQC procedures as per industry best practice. - All drill core is geologically, structurally, and geotechnically logged and photographed prior to cutting.

Criteria	JORC Code Explanation	Commentary
		- Quarter core and half core samples are taken from diamond core holes using an automatic core saw. - The drill core is sampled nominally as one metre samples with adjustments for major geological boundaries, with sample lengths ranging between 0.3m and 1.2m. - Drill core samples are submitted to the lab for assay. Air Core Sampling - CY2026 to date a total of 54 air core drill holes have been completed on the Minyari Project for a total of 3,111 metres, with an average hole depth of 58m: - All 54 air core drill holes were testing the AL01 gold trend. - No assays results have been received. - Locations and orientations for these air core drill holes are tabulated in the body of this report. - One metre samples were collected from a cyclone into a plastic bucket and then laid out on the ground in rows of 15. - Air core sample piles representing 1m intervals were spear sampled to accumulate 4m composite samples for analysis, with a total of 2 to 3 kg collected into pre-numbered calico bags. - The final metre of each hole was spear sampled to collect a total of 2 to 3 kg of cuttings into a pre-numbered calico bag. - All samples are pulverised at the laboratory to produce material for assay.
Drilling techniques	<i>Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).</i>	RC Drilling - RC drill holes are completed with a Schramm Epiroc 685 drill rig equipped with a 1,350cfm/500psi compressor and air truck with a 2,500cfm/1,000psi booster compressor owned and operated by Topdrill Pty Ltd. - All RC drill holes are completed using 140mm RC face sampling hammer drill bit from surface to total drill hole

Criteria	JORC Code Explanation	Commentary
		depths of between 66 to 360 metres. Diamond Core Drilling • Diamond core drill holes are completed with a Boart Longyear LF160T drill rig owned and operated by Hagstrom Drilling Pty Ltd. • Diamond core drill holes are completed with standard tube with a PQ diameter equipment at the start of hole to a designated depth depending on ground conditions and/or drill hole requirements. This is followed by HQ to a designated depth, then NQ to the end of hole. • The depth for the first diamond core drill hole which is in progress is currently 350 metres. • All diamond core was orientated using a north-seeking gyro electronic orientation tool. • All diamond core drill holes for geotechnical purposes used triple tube barrels. Air Core Drilling • Air core drill holes are completed with a Mantis 300 drill rig equipped with a 600cfm/200psi compressor owned and operated by Wallis Drilling Pty Ltd. • All air core drill holes are completed using an 85mm air core blade bit from surface to total drill hole depths of between 15 to 150 metres.
Drill sample recovery	• <i>Method of recording and assessing core and chip sample recoveries and results assessed.</i> • <i>Measures taken to maximise sample recovery and ensure representative nature of the samples.</i> • <i>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</i>	RC and Air Core • RC and air core sample recovery was recorded via visual estimation of sample volume, typically ranging from 90% to 100%, with only very occasional samples with less than 70% recovery. • RC and air core sample recovery was maximized by endeavoring to maintain dry drilling conditions as much as practicable; the majority of RC samples were dry. • All RC samples were split using the drill rig's mounted cone splitter. Adjustments were made to ensure representative 2 to 3 kg sample were collected.

Criteria	JORC Code Explanation	Commentary
		- Relationships between recovery and grade are not evident and are not expected given the generally excellent and consistently high sample recovery. Diamond Core - Core recovery is recorded as a percentage. Overall core recoveries averaged over 99.5% and there are no core loss issues or significant sample recovery problems except for infrequent, very localised/limited regions. - Drillers used appropriate measures to maximise diamond core sample recovery. - There is no relationship between sample recovery and/or mineralisation grade as the diamond core recovery was consistently high.
Logging	<i>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</i> <i>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.</i> <i>The total length and percentage of the relevant intersections logged.</i>	- Geological logging of all RC, air core and DD intervals was carried out recording colour, weathering, lithology, mineralogy, alteration, veining, and sulphides. - Logging includes both qualitative and quantitative components. - Logging was completed for 100% of all drill holes. - All RC, air core and DD intervals were measured for magnetic susceptibility using a handheld Magnetic Susceptibility meter. - A total of 10,096 metres of RC drill chip samples from 1 metre intervals have been logged. - A total of 350 metres of diamond core have been logged. - A total of 3,111 metres of air core drill chip samples from one metre intervals have been logged.
Sub-sampling techniques and sample preparation	<i>If core, whether cut or sawn and whether quarter, half or all core taken.</i> <i>If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.</i> <i>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</i> <i>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</i>	RC Samples - RC samples for all drill holes were drilled using a 140mm diameter face sampling hammer. - Samples were collected as 1m splits from the rig mounted cone splitter. - Field duplicate samples were collected for all RC drill holes. - The majority of the samples were dry. - Individual (one) metre (2 to 3 kg) samples or two to four

Criteria	JORC Code Explanation	Commentary
	- Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling. - Whether sample sizes are appropriate to the grain size of the material being sampled.	metre composite samples (2 to 3 kg) were submitted for laboratory analysis. Diamond Core Samples - Core was either quarter core sampled in PQ diameter core, or half core sampled in HQ and NQ diameter core at a nominal 1.0m sample interval within unmineralised zones and on 0.3 to 1.2m intervals within the mineralised zones. Air Core Samples - One metre samples were collected from a cyclone into a plastic bucket and then laid out on the ground in rows of 15. - Compositing air core samples of between 2 to 4 m was undertaken via combining 'Spear' samples of the intervals to generate a 2 kg (average) sample. Sample Preparation - Each sample was pulverised at the laboratory to produce material for assay. - Sample preparation was carried out at ALS using industry standard crush and/or pulverizing techniques. Preparation includes over drying and pulverizing of the entire sample using Essa LM5 grinding mill to a grid size of 85% passing 75 µm. - The sample sizes are considered appropriate for the style of mineralisation across the Minyari Project.
Quality of assay data and laboratory tests	- The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total. - For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc. - Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks)	- All drill samples were submitted to ALS in Perth for preparation and analysis. - All samples were dried, crushed, pulverised, and split to produce a sub-sample for laboratory analysis. RC and Diamond Core Sample Analysis - Each sub-sample is digested and refluxed with hydrofluoric, nitric, hydrochloric and perchloric acids ("four acid digest"). This digest is considered to approach a total dissolution for

Criteria	JORC Code Explanation	Commentary
	<i>and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.</i>	most minerals. Analytical analysis is performed using a either ICP-AES or ICP-MS. Resource Definition suite (ICP-AES): Ag, Al, As, Ba, Be, Bi, Ca, Cd, Ce, Co, Cr, Cu, Fe, K, La, Li, Mg, Mn, Mo, Na, Ni, P, Pb, S, Sb, Sc, Sn, Sr, Te, Ti, Tl, V, W and Zn. Targeted exploration suite (ICP-MS): Al, As, B, Ba, Be, Bi, Ca, Cd, Ce, Co, Cr, Cs, Cu, Fe, Ga, Ge, Hf, Hg, In, K, La, Li, Mg, M, Mo, Na, Nb, Ni, P, Pb, Pd, Pt, Rb, Re, S, Sb, Sc, Se, Sn, Sr, Ta, Te, Th, Ti, Tl, U, V, W, Y, Zn and Zr. • A lead collection fire assay on a 50 gm sample with Atomic Absorption Spectroscopy was undertaken to determine gold content with a detection limit of 0.01 ppm. Air Core Sample Analysis • Each composite sub-sample was digested in a mixture of 3-parts hydrochloric acid and 1-part nitric acid ('aqua regia digest'), suitable for weathered air core samples. Aqua regia can digest many different mineral types including most oxides, sulphides and carbonates but will not totally digest refractory or silicate minerals. Analytical methods used were both ICP-AES and ICP-MS (Au, Ag, Al, As, Ba, Be, Bi, Ca, Cd, Ce, Co, Cr, Cs, Cu, Fe, Ga, Hf, In, K, La, Li, Mg, Mn, Mo, Na, Nb, Ni, P, Pb, Pd, Pt, Rb, Re, Sb, Sc, Se, Sn, Sr, Ta, Te, Th, Ti, Tl, U, V, W, Y, Zn and Zr). • End of hole sub-samples were analysed using a Multi-Element Ultra Trace method combining a four-acid digestion with ICP-MS instrumentation. A four-acid digest is performed on 0.25g of sample to quantitatively dissolve most geological materials. Analytical analysis performed with a combination of ICP-AES and ICP-MS. Four acid digestions quantitatively dissolve nearly all minerals (Ag, Al, As, Ba, Be, Bi, Ca, Cd, Ce, Co, Cr, Cu, Fe, K, La, Li, Mg, Mn, Mo, Na, Ni, P, Pb, S, Sb, Sc, Sn, Sr, Te, Ti, Tl, V, W and Zn). • A lead collection fire assay on a 50 gm sample with an ICP-AES finish was undertaken on end of hole samples to determine gold content with a detection limit of 0.001 ppm.

Criteria	JORC Code Explanation	Commentary
		RC, Diamond Core and Air Core Samples - Additional ore-grade analysis was performed as required for other elements reporting out of range. - Field QC procedures involve the use of commercial certified reference material (CRM) for assay standards and blanks. Standards are inserted every 25 samples. The grade of the inserted standard is not revealed to the laboratory. - Field duplicates/repeat QC samples was utilised during the drill programmes with nominally 1 in 30 duplicate samples submitted for laboratory assay for each drill hole, with additional duplicate samples submitted in mineralized zones. - Inter laboratory cross-checks analysis programmes have not been conducted at this stage. - In addition to Antipa supplied CRM's, ALS includes in each sample batch assayed certified reference materials, blanks and up to 10% replicates. - If necessary, anomalous results are redigested to confirm results.
Verification of sampling and assaying	<i>The verification of significant intersections by either independent or alternative company personnel.</i> <i>The use of twinned holes.</i> <i>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</i> <i>Discuss any adjustment to assay data.</i>	- Significant drill intersections have been visually verified by multiple members of the Antipa geology team, including the Exploration Manager. - All logging is entered directly into a notebook computer using the Antipa Proprietary Logging System which is based on Microsoft Excel. The logging system uses standard look-up tables that does not allow invalid logging codes to be entered. Further data validation is carried out during upload to Antipa's master SQL database. - No adjustments or calibrations have been made to any laboratory assay data collected.
Location of data points	<i>Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</i> <i>Specification of the grid system used.</i> <i>Quality and adequacy of topographic control.</i>	- km = kilometre; m = metre; mm = millimetre. - When possible, drill hole collar locations have been recorded using a differential GPS with a stated accuracy of ± 0.5 metres. Otherwise drill hole collar locations are recorded using a standard handheld GPS which has a stated accuracy of ± 5 to 10 metres.

Criteria	JORC Code Explanation	Commentary
		- The drilling co-ordinates are in GDA2020 MGA Zone 51 co-ordinates. - The Company has adopted and referenced one specific local grid across the Minyari Dome region ("Minyari" Local Grid) which is defined below. References in the text and the Minyari deposit diagrams are all in this specific Minyari Local Grid. - Minyari Local Grid 2-Point Transformation Data: - Minyari Local Grid 47,400m east is 421,462.154m east in GDA94 / MGA Zone 51; - Minyari Local Grid 99,000m north is 7,632,467.588 m north in GDA94 / MGA Zone 51; - Minyari Local Grid 47,400m east is 414,078.609m east in GDA94 / MGA Zone 51; - Minyari Local Grid 113,000m north is 7,644,356.108m north in GDA94 / MGA Zone 51; - Minyari Local Grid North (360°) is equal to 328.2° in GDA94 / MGA Zone 51; and - Minyari Local Grid elevation is equal to GDA20 / MGA Zone 51. - The topographic surface has been compiled using Light Detection and Ranging (LiDAR) November 2025 survey data. - Surveys were completed upon hole completion using a Reflex Gyro downhole survey instrument. - Surveys were checked by the supervising Geologist for consistency. If required, readings were re-surveyed or smoothed in the database if unreliable azimuth readings were apparent. - Survey details included drill hole dip ($\pm 0.25^\circ$ accuracy) and drill hole azimuth ($\pm 0.35^\circ$ accuracy), Total Magnetic field and temperature.
Data spacing and distribution	<i>Data spacing for reporting of Exploration Results.</i> <i>Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</i>	Targeted exploration drill hole collar locations are typically drilled on a range of hole spacings testing geophysical targets (e.g. magnetic, induced polarisation, electromagnetic, gravity) and/or air core targets and/or surface sampling (soil) geochemical anomalies.

Criteria	JORC Code Explanation	Commentary
	<i>Whether sample compositing has been applied.</i>	- Mineral Resource definition and/or extension drill holes are typically drilled on a specified drill hole spacing to increase confidence appropriate to Mineral Resource classification. Across the Minyari Project deposits, these generally occur as either 25 metre or 50 metre grids. - The drill hole spacing for a number of deposits at Minyari Dome (e.g. Minyari, Minyari South, WACA and GEO-01 Area) and satellite deposits (e.g. Tim's Dome, Chicken Ranch and RPS) the drill hole spacing of the RC $\pm$ diamond core drilling is sufficient to establish the geological and grade continuity suitable for Mineral Resource estimation. - The current drill hole spacing at a number of prospects and exploration targets is not sufficient for Mineral Resource estimation. - Reported intersections were aggregated using downhole length weighting of consecutive drill hole sample laboratory assay results.
Orientation of data in relation to geological structure	<i>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</i> <i>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</i>	- The location and orientation of the Minyari Project drilling is appropriate given the strike, dip, and morphology of the mineralisation. - No consistent and/or material sampling bias resulting from a structural orientation has been identified across the Minyari Project at this stage; however, folding, and multiple vein directions have been recorded via surface mapping and (orientated) diamond core and Televue surveyed RC drill holes.
Sample security	<i>The measures taken to ensure sample security.</i>	- Chain of sample custody is managed by Antipa to ensure appropriate levels of sample security. - Samples are stored on site and delivered by Antipa or their representatives to Port Hedland and subsequently by RGR Transport Pty Ltd from Port Hedland to the laboratory in Perth.
Audits or reviews	<i>The results of any audits or reviews of sampling techniques and data.</i>	- Sampling techniques and procedures are regularly reviewed internally, as is all data. - Consultants Snowden, during completion of the 2013

Criteria	JORC Code Explanation	Commentary
		Calibre Mineral Resource estimate, undertook a desktop review of the Company's sampling techniques and data management and found them to be consistent with industry standards.

Table 1 - Section 2 – Reporting of Exploration Results (Criteria listed in the preceding section also apply to this section)

Criteria	JORC Code explanation	Commentary
<i>Mineral tenement and land tenure status</i>	<i>Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.</i> <i>The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</i>	- Drill holes completed in the various CY2026 drilling programmes are drilled on the following tenements: - E45/2526, E45/2527, E45/2528, E45/3917, E45/3918, E45/3919, E45/3925, E45/4565, E45/4618, E45/5135, E45/5153, E45/5154, E45/5157, E45/5158, E45/5458 and E45/5460, E45/5461 and E45/5462. - Antipa Minerals Ltd's interests in the Exploration Licences detailed above are not subject to any third-party Farm-in or Joint Venture agreements. - A 1.5% net smelter royalty is payable to Newcrest Operations Ltd (a wholly owned subsidiary of Greatland Resources Ltd) on the sale of all metals on Exploration Licences E45/4812, E45/5079, E45/5147, and E45/5148. - A 1.0% net smelter royalty is payable to International Royalty Corporation on the sale of all metals (excluding uranium) on Exploration Licences E45/3918 and E45/3919. - A Split Commodity Agreement exists with Paladin Energy Ltd's wholly owned subsidiary North Gascoyne Mining Pty Ltd whereby it owns the rights to uranium on Exploration Licences E45/3918 and E45/3919. - The Minyari, WACA, GEO-01 Area, WACA West, Minyari South, Minyari North and Sundown Mineral Resources are located wholly within Exploration Licence E45/3919. - The Rizzo and GEO-01 South Mineral Resources are located on tenements E45/3919 and E45/5458. - The Tim's Dome Mineral Resource is located within

Criteria	JORC Code explanation	Commentary
		Exploration Licences E45/4565 and E45/2526. - The Chicken Ranch Mineral Resource is located within Exploration license E45/4867. - These tenements are contained completely within land where the Martu People have been determined to hold Native Title rights. To the Company's knowledge no historical or environmentally sensitive sites have been identified in the area being actively explored and reported herein. - The tenements are in good standing, and no known impediments exist.
<i>Exploration done by other parties</i>	<i>Acknowledgment and appraisal of exploration by other parties.</i>	- The Minyari and WACA deposits were greenfield discoveries by the Western Mining Corporation Ltd during the early 1980's. - Exploration of the Minyari Dome region has involved the following companies: - Western Mining Corporation Ltd (1980 to 1983); - Newmont Holdings Pty Ltd (1984 to 1990); - MIM Exploration Pty Ltd (1990 to 1991); - Newcrest Mining Limited (1991 to 2015); and - Antipa Minerals Ltd (2016 onwards). - Exploration across various regions within the remainder of the Minyari Project has been conducted by the following companies: - Carr Boyd Minerals Ltd (1973 to 1975); - Geopeko Limited (JV with Carr Boyd) (1978); - Marathon Petroleum Australia Limited (1979); - Western Mining Corporation Limited (WMC) (1980); - Duval Mining (Australia) Limited (Carr Boyd JV with Picon Exploration Pty Ltd) (1984 to 1986); - Newmont (1984 to 1989); - Mount Burgess Gold Mining Company N.L. (1989 to 2001); - Carpentaria - MIM JV with Mount Burgess (1990 to 1996); - BHP Australia (1991 to 1998);

Criteria	JORC Code explanation	Commentary
		• Mount Isa Mines Exploration (1993 to 1998); • Normandy - JV with Mount Burgess (1998 to 2000); • MIM Exploration Pty Ltd (1990 to 1993); • Newcrest (1987 to 2015); • Quantum Resources Limited (2012 to 2016); • IGO Ltd - former Farm-In JV with Antipa (July 2020 to April 2025); • Newcrest Mining Ltd – Former Farm-In JV with Antipa (March 2020 to Nov 2023); and • Newmont Corporation - Former Farm-In JV with Antipa (Nov 2023 – May 2025).
<i>Geology</i>	• <i>Deposit type, geological setting and style of mineralisation.</i>	• The geological setting is Paterson Province Neoproterozoic aged meta-sediment and meta-mafic hosted hydrothermal shear, fault and strata/contact controlled precious and/or base metal mineralisation which is typically sulphide bearing. • The Paterson Province is a low grade metamorphic terrane but local hydrothermal alteration and/or contact metamorphic mineral assemblages and styles are indicative of a moderate to high-temperature local environment. • The Neoproterozoic precious and base metal mineralisation in the region is interpreted to be intrusion related. Typical mineralisation styles include reef, vein, stockwork, breccia and skarns. • The gold-copper-silver mineralisation at Minyari Dome is interpreted to be reduced intrusion related, with dominant mineralisation styles being quartz±amphibole±pyroxene ±calcite-sulphide (Po>Cp>Py) vein/stockwork, breccia and associated albite dominated hydrothermal alteration/replacement.
<i>Drill hole Information</i>	• <i>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:</i> • <i>easting and northing of the drill hole collar;</i> • <i>elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar;</i>	• Summaries of all information material to the understanding of these exploration results can be found in the body of this report. • A summary of all available information material to the understanding of the Minyari Project exploration results can also be found in previous Western Australian (WA)

Criteria	JORC Code explanation	Commentary
	- dip and azimuth of the hole; - down hole length and interception depth; - hole length; and - If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.	Department of Local Government, Industry Regulation and Safety (DMPE) publicly available reports. - All the various technical Minyari Project exploration reports are publicly accessible via the DMPE online WAMEX system. - The specific WAMEX and other reports related to the exploration information on the subject of this public disclosure have been referenced in previous public reports.
Data aggregation methods	- In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g. cutting of high grades) and cut-off grades are usually Material and should be stated. - Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail. - The assumptions used for any reporting of metal equivalent values should be clearly stated.	- Drill hole intersections consisting of more than one sample were aggregated using downhole length weighting of consecutive drill hole sample laboratory assay results. - No top-cuts to gold, copper, silver, or cobalt have been applied (unless specified otherwise). - A nominal 0.1 g/t gold, 300 ppm copper (Discovery focused) or 400 ppm copper (PFS or Growth focused), 0.7 g/t silver and 400 ppm cobalt lower cut-off grades have been applied during data aggregation of RC and DD results. - For Air Core, a nominal 30ppb gold, 200 ppm copper, 0.5 g/t silver, 100 ppm cobalt lower cut-off grades have been applied during data aggregation methods. - Higher grade intervals of mineralisation internal to broader zones of mineralisation are reported as included intervals. - Metal equivalence has not been used in the reporting of these drill intersections.
Relationship between mineralisation widths and intercept lengths	- These relationships are particularly important in the reporting of Exploration Results. - If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported. - If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g. 'down hole length, true width not known').	- At this stage, the reported intersection lengths are down hole in nature and the true width, which will be dependent on the local mineralisation geometry/setting, is not always known. - Mineralisation at the various deposits and greenfield prospects across the Minyari Project consist of meta-sediment hosted plus lesser mafic and felsic intrusion hosted intrusion related hydrothermal alteration, breccia, and vein style gold-copper-silver-cobalt mineralisation. - For the Minyari Dome deposits, drill holes are designed to intersect the mineralisation orthogonally based on current mineralisation interpretations. Therefore, the reported downhole mineralisation intercepts for a number of these

Criteria	JORC Code explanation	Commentary
		specific drill holes are considered to more reliably represent approximate true widths. Based on limited drilling information, mineralisation at the greenfields prospects is interpreted to be generally steeply dipping and striking between approximately 320° to 350°, with pre-mineralisation folding resulting in local variations in geometry.
<i>Diagrams</i>	<i>Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</i>	- Appropriate plans and sections (cross-section/s and long section/s) (with scales) for any significant/material discovery, Mineral Resource extension or Mineral Resource definition results being reported and tabulations of intercepts are provided in the body of this report or have previously been publicly reported or can sometimes be found in WA DMPE WAMEX publicly available reports. - Cross-sections are not provided for any drill hole/s which are not considered significant/material in relation to discoveries, Mineral Resource definition/extension, and/or where all analytical data is not currently available. - All notable drill intersections are included in Table 1. - Antipa Minerals Ltd publicly disclosed reports provide maps and sections (cross sections and long section/s) (with scales) and tabulations of intercepts generated by the Company since 2011; these reports are all available to view on www.antipaminerals.com.au and www.asx.com.au, and can sometimes be found in WA DMPE WAMEX publicly available reports.
<i>Balanced reporting</i>	<i>Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</i>	All significant results are reported or can sometimes be found in WA DMPE WAMEX publicly available reports.
<i>Other substantive exploration data</i>	<i>Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious</i>	- All meaningful and material information has been included in the body of the text or can sometimes be found in WA DMPE WAMEX publicly available reports. - The details of the Minyari Dome region historic Induced Polarisation (IP) survey, including IP Chargeability and resistivity anomalies, can be found in WA DMPE publicly

Criteria	JORC Code explanation	Commentary
	or contaminating substances.	available WAMEX reports A81227 (2008), A86106 (2009) and A89687 (2010). • The details of the Company's reprocessing, review, and modelling of the Minyari Dome region historic Induced Polarisation survey, including IP Chargeability and resistivity anomalies, can be found in the Company's ASX report titled "Minyari Reprocessed IP Survey Results" created on 5 July 2016. • Zones of mineralisation and associated waste material have not been measured for their bulk density; however, Specific Gravity ("Density") measurements continue to be taken from diamond drill core. • Multi element laboratory assaying was conducted variously for a suite of potentially deleterious elements including arsenic, sulfur, lead, zinc, and magnesium. • Downhole "logging" of a selection of Minyari deposit RC drill holes was undertaken as part of the 2016 and 2021 drill programs using an OBI40 Optical Televiewer which generated an oriented 360-degree image of the drill hole wall via a CCD camera recorded digital image. The OBI40 system utilised also included a North Seeking Gyro-scope to measure drill hole location/deviation, and the downhole survey also measured rock density, magnetic susceptibility, natural gamma and included a borehole caliper device for measuring drill hole diameter. The combined dataset collected via the OBI40 Optical Televiewer downhole survey data has multiple geological and geotechnical uses, including but not limited to the detection and determination of in-situ lithological, structural and mineralisation feature orientations (i.e. dip and strike), determination and orientation of fracture frequency, general ground conditions/stability, oxidation conditions, ground-water table, and clarity, etc. • Information on structure type, dip, dip direction, alpha angle, beta angle, gamma angle, texture and fill material derived mainly from diamond drill core is stored in the Company's technical SQL database.

Criteria	JORC Code explanation	Commentary
		- No information on structure type, dip, dip direction, alpha angle, beta angle, gamma angle, texture and fill material were obtained from the WAMEX reports. - Preliminary metallurgical test-work results are available for both the Minyari and WACA gold-copper-silver-cobalt deposits, these 13 June 2017 and 27 August 2018 metallurgical reports are available to view on www.antipaminerals.com.au and www.asx.com.au: - Refer to Antipa Minerals ASX release dated 13 June 2017 “Minyari Dome Positive Metallurgical Test Work Results”; and - Refer to Antipa Minerals ASX release dated 26 August 2018 “Minyari Dome Excellent Metallurgical Test-work Results”. - This preliminary metallurgical test-work was completed at the Bureau Veritas Minerals Pty Ltd laboratories in Perth, Western Australia under the management of metallurgical consultants Strategic Metallurgy Pty Ltd in conjunction with Bureau Veritas metallurgists and Antipa’s Managing Director. - The 2017 metallurgical test-work demonstrated excellent gold recoveries for both oxide and primary mineralisation from the Minyari and WACA deposits, with the 2018 metallurgical test-work confirming the potential for the Minyari and WACA to produce copper-gold concentrate and cobalt-gold concentrate product with extremely favourable results. Optimisation of metallurgical performance is expected via additional test-work. - In addition, the following information in relation to metallurgy was obtained from WA DMPE WAMEX reports: - Newmont Holdings Pty Ltd collected two bulk (8 tonnes each) metallurgical samples of oxide mineralisation in 1987 (i.e. WAMEX 1987 report A24464) from a 120m long costean across the Minyari deposit. The bulk samples were 8 tonnes grading 1.5 g/t gold and 8 tonnes grading 3.57 g/t gold from below shallow cover in the costean.

Criteria	JORC Code explanation	Commentary
		However, it would appear the Newmont metallurgical test-work for these two bulk samples was never undertaken/competed as no results were subsequently reported to the WA DMPE. - Newmont Holdings Pty Ltd also collected drill hole metallurgical samples for Minyari deposit oxide and primary mineralisation (i.e. WAMEX 1986 report A19770); however, subsequent reporting of any results to the WA DMPE could not be located suggesting that the metallurgical test-work was never undertaken/competed. - Newcrest Mining Ltd describe the Minyari deposit gold-copper mineralisation as being typical of the Telfer gold-copper mineralisation. In 2004 and 2005 (WAMEX reports A71875 and A74417) Newcrest commenced metallurgical studies for the Telfer Mine and due to the similarities with the Minyari mineralisation a portion of this Telfer metallurgical test-work expenditure was apportioned to the then Newcrest Minyari tenements. Whilst Telfer metallurgical results are not publicly available, the Telfer Mining operation (including ore processing facility) was materially expanded in the mid-2000's and continues to operate with viable metallurgical recoveries (for both oxide and primary mineralisation).
Further work	- The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions or large-scale step-out drilling). - Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.	- Additional potential exploration activities are outlined in the body of this report. - The Minyari Dome PFS remains in progress. - Appropriate plans and sections (cross-sections and long section/s) (with scales) and tabulations of intercepts are provided in the body of this report or have previously been publicly or previously reported by Antipa or can sometimes be found in WA DMPE WAMEX publicly available reports.
